Main Conference

Problem Setting

LV segmentation from echocardiography is essential for cardiac function assessment, yet challenging due to:

- Severe speckle noise & low contrast
- Rapid non-rigid deformation (systole $\leftrightarrow$ diastole)
- Sparse annotations (ED/ES frames only)

Figure 1. Challenges: speckle noise, blurred contours, and shape variations.

Our Approach

We propose **OSA** — joint temporal stabilization + anatomy-aware enhancement:

- **OSU**: Stiefel manifold constraint prevents rank collapse
- **APFE**: Physics-driven decoupling separates anatomy from speckle

Under sparse supervision (ED/ES only), the objective is:

$$L(\theta) = \ell(\hat{y}_I, y_I) + \ell(\hat{y}_T, y_T)$$

Figure 2. Paradigm comparison: Memory Bank, LRM, and OSA.

Motivation

Existing video segmentation models ignore ultrasound-specific noise statistics, while temporal models suffer from state degradation. OSA addresses both jointly:

Method Overview

OSA segments LV using a **ResNet-50** backbone.

Figure 3. OSA architecture: APFE $\rightarrow$ OSU $\rightarrow$ decoder.

Pipeline:

1. ResNet-50 extracts features F_t
2. APFE decomposes into keys/values
3. OSU maintains state S_t on Stiefel manifold
4. Query $Q_t \otimes S_t$
5. Decoder outputs mask M_t

Contributions

- First unified temporal + ultrasound-aware architecture
- Stiefel constraint prevents rank collapse
- Physics-driven decoupling for noise resilience
- **Stiefel manifold**: $S_t \in \mathcal{V}_{C_v, C_k}$ with $S^T S = I$
- **Newton-Schulz projection**: avoids exact SVD, $O(1)$ fixed steps

Ablation Study

Full: 94.82 mDice. w/o APFE: 93.61. w/o OSU: 94.12. Both essential.

Method	mDice $\uparrow$	mHD95 $\downarrow$	Mem $\downarrow$	Time $\downarrow$
Baseline	92.94	3.56	7.5	4.5
w/o APFE	93.61	3.29	7.6	3.0
w/o OSU	94.12	3.21	7.5	4.7
Full	94.82	3.25	7.6	3.0

Table 2. Ablation study on CAMUS.

$$X_t = X_t^+ - X_t^- + M_t$$

Lossless residual decomposition (APFE)

Orthogonalized State Update

Linear recurrent models suffer **rank collapse**: unconstrained updates decay singular values in S_t .

State Update on Stiefel Manifold

$$S_t = \text{OrthProj}_{\text{Stiefel}}(S_{t-1} + \eta \cdot \nabla S L)$$

via Newton-Schulz iteration + weight decay

OSU projects state updates onto the Stiefel manifold, ensuring stable transitions across the cardiac cycle.

Figure 4. OSU: orthogonalized update preserves manifold structure.

Anatomical Prior-aware Feature Enhancement

APFE decouples anatomy from speckle noise via **physics-driven decomposition**, building stable structural anchors.

Figure 5. APFE: contrast decomposition provides noise-resilient cues.

Quantitative Results

SOTA on **CAMUS & EchoNet-Dynamic** across mDice, mIoU, HD, and ASD.

Method	CAMUS				EchoNet-Dynamic			
	mDice $\uparrow$	mHD95 $\downarrow$	corr $\uparrow$	bias $\pm$ std (%)	mDice $\uparrow$	mHD95 $\downarrow$	corr $\uparrow$	bias $\pm$ std (%)

Table 1. Segmentation performance on CAMUS and EchoNet-Dynamic.

Dataset Details

CAMUS: 500 patients, A4C + A2C views, 2D+T, ED/ES annotations. Resized to 256 $\times$ 256, 15 frames.

EchoNet-Dynamic: 10,030 A4C videos, 112 $\times$ 112, 10 frames. Sparse labels (ED/ES only).

$$mDice = 2|X \cap Y| / (|X| + |Y|)$$

$$mIoU = |X \cap Y| / |X \cup Y|$$

Clinical metrics: LVEF via Simpson's rule, Pearson r , bias $\pm$ std.

Qualitative Comparison

OSA shows superior boundary adherence and fewer false positives in speckle-dense regions.

Figure 6. Visual comparison. Green = GT, Red = pred, Yellow = overlap.
